1 Introduction

2 Related Work

This research is the latest on a long line of academic articles on the topics of retrieval-augmented generation, counterparametric and contextual data, and how to enhance knowledge on large language models.

This section presents a short summary of some of the articles that were useful in researching this topic.

2.1 Foundational Papers on Large Language Models

- “Language models are unsupervised multitask learners” (Radford et al. 2019).
 - The foundational paper for GPT2.
- “Exploring the Limits of Transfer Learning with a Unified Text-to-Text Transformer” Raffel et al. (2020).
 - The foundational paper for T5.
- “Language Models are Few-shot Learners” Brown et al. (2020).
 - Introduces “in-context learning”.
- “Prompt programming for large language models: Beyond the few-shot paradigm” Reynolds & McDonell (2021).
 - Improves the previous paper.

2.2 Papers working with RAG and contextual data

- “Retrieval-Augmented Generation for Knowledge-Intensive NLP Tasks” Lewis et al. (2020).
 - Foundational paper for RAG.
- “Self-RAG: Learning to Retrieve, Generate, and Critique through Self-Reflection” Asai et al. (2023).
 - Interesting RAG system.
- “Can Retriever-Augmented Language Models Reason? The Blame Game Between the Retriever and the Language Model” Behnam Ghader et al. (2023).
 - Nice evaluation of RAG models.

2.3 Retrieval-Augmented Language Models

- “Shall We Pretrain Autoregressive Language Models with Retrieval? A Comprehensive Study” Wang et al. (2023).

*This entire section is in progress — short summaries of the named papers will come soon.

- Reproduces and pretrains RETRO.
- “Atlas: Few-shot Learning with Retrieval Augmented Language Models” Izacard et al. (2022).
 - Introduces ATLAS.
- “Improving language models by retrieving from trillions of tokens” Borgeaud et al. (2022).
- “RAGGED: Towards Informed Design of Retrieval Augmented Generation Systems” Hsia et al. (2024).
 - Analyses results of these systems; compares Llama to Flan-T5.

2.4 On disentangling parametric and context-augmented counterparametric knowledge

- “DISCO: Distilling Counterfactuals with Large Language Models” Chen et al. (2023).
 - Does similar analysis with counterfactuals to this thesis
- “DisentQA: Disentangling Parametric and Contextual Knowledge with Counterfactual Question Answering” Neeman et al. (2022).
 - Also does a similar analysis to this thesis.
- “Characterizing Mechanisms for Factual Recall in Language Models” Yu et al. (2023).
 - Very simple analysis, but tries to understand WHERE in the model the contextual answers come from.
- “Can We Edit Factual Knowledge by In-Context Learning?” Zheng et al. (2023).
- “Learning the Difference that Makes a Difference with Counterfactually-Augmented Data” Kaushik et al. (2020).

3 Problem Statement

4 Models and Resources

- **Reader Models**

- Llama-8B.
- Llama-70B.
- Flan-T5-XL.
- Flan-T5-XXL.
- *Atlas?*

- **Questions**

- Our own dataset, shown in Appendix A.
- *Maybe add Natural Questions, HotpotQA, and/or BioASQ as in RAGGEDHsia et al. (2024).*

5 Methodology

5.1 Source Data Preparation

Our source data is prepared by extending the ideas presented by Yu et al. (2023). Instead of using one simple question, our approach consists of separating this data into 7 categories, where each category has a set of base questions and another set of objects that are paired together and presented to our models.

This work contains 7 categories in the configuration shown by Table 1, for a total of 3840 questions. The full list of questions can be found in Appendix A.

Category	Questions	Objects	Total
Person	14	47	658
City	14	60	840
Principle	10	30	300
Element	10	35	350
Book	10	45	450
Painting	14	39	546
Historical Event	6	56	336
Total	68	312	3840

Table 1: The amount of questions for each category. The full list of questions can be found in Appendix A. This is still a work in progress and I expect to add more questions.

We enhance the zero-shot learning prompt used by Brown et al. (2020) by using the prompt format example format presented by Jiang et al. (2021) for calibrating the T5 language model by adding both the question and the first part of the answer.

5.2 Prompting

There is plenty of research that suggests that for zero-shot problems Brown et al. (2020), Reynolds & McDonell (2021), it’s convenient to create a minimal prompt Jiang et al. (2021), Yu et al. (2023). This is helpful when later calculating the perplexity of the answers, as it tends to bias for short answers without any extra information that might change the individual probabilities of each token.

Examples of the prompting format explained in Sections 5.1 and 5.2 can be found in Table 2. For later queries, this is enhanced with context as in Table 3.

5.3 Generating and scoring parametric answers

We query each of the models listed in Section 4 with the data from the previous subsections.

To ensure results are simple to interpret and not affected by randomness, we follow the example of Hsia et al. (2024) and use greedy decoding to find the answer. While beam search with a short beam width tends to produce more accurate results for

Base Question	Object	Final Question
What is the date of birth of {person}?		Q: What is the date of birth of Che Guevara?
The date of birth of {person} is	Che Guevara	A: The date of birth of Che Guevara is
In what city was {person} born?	Confucius	Q: What is the date of birth of Confucius?
{person} was born in	Cairo	A: The date of birth of Confucius is
What country is {city} in?	Mumbai	Q: In what city was Che Guevara born?
{city} is in		A: Che Guevara was born in
		Q: In what city was Confucius born?
		A: Confucius was born in
		Q: What country is Cairo in?
		A: Cairo is in
		Q: What country is Mumbai in?
		A: Mumbai is in

Table 2: Some examples of the base-question and object generation that are fed to the models for finding parametric answers.

long answers Sutskever et al. (2014), Wu et al. (2016) and there are many other sampling methods that produce better results Holtzman et al. (2020), this is likely to not have an effect on experiments that result in shorter answers Raffel et al. (2020).

The negative log-likelihood of an answer x is calculated in base of the conditional probability of generating each token given the prior tokens. We can use this value to calculate the perplexity, which measures the level of “surprise” of a particular answer.

$$\begin{aligned}
\text{NLL}(x_1, \dots, x_N | Q) &= -\frac{1}{N} \sum_{i=1}^N \log P(x_i | Q, x_{i-1}, \dots, x_1) \\
\text{PPL}(x_1, \dots, x_N | Q) &= e^{\text{NLL}(x_1, \dots, x_N | Q)}
\end{aligned} \tag{1}$$

We can ensure that the probabilities are calculated based on the intended tokens rather than the “most probable” generated ones by using teacher forcing Lamb et al. (2016).

5.4 Shuffling to generate counterparametric answers

Previous work related to finding per token probabilities of answers in large language models focus on either a pre-existing list of questions or on a single question format Yu et al. (2023). This approach does not work for our use case for three reasons.

1. Having 68 different types of questions, rather than just 1, makes finding counterfactual answers technically challenging.
2. Our focus is not on finding *counterfactual* answers, but *counterparametric* ones. We do not care about correctness; we care about answers not being parametric.
3. Since we are measuring perplexity of these answers, we focus on answers that are generated by the same base question and the same model. This way we ensure that the format of the answer is the same.

		Tokens	
		Parametric p	Counterparametric \bar{p}
Context	Empty Q	$\text{PPL}(p_1, \dots, p_N \mid Q)$	$\text{PPL}(\bar{p}_1, \dots, \bar{p}_{\bar{N}} \mid Q)$
	Counterparametric W	$\text{PPL}(p_1, \dots, p_N \mid W)$	$\text{PPL}(\bar{p}_1, \dots, \bar{p}_{\bar{N}} \mid W)$

Figure 1: Four different perplexity values: one for each set of tokens, and one for each query context..

We propose a novel way of generating counterparametric answers while focusing on these three points: rather than generating new answers for each question, counterfactual answers are randomly sampled from the parametric answers corresponding to the same base question. An example of this approach can be seen in Table 3.

5.5 Counterparametric and contextual perplexity scores

This work extends the approach of analysing answers found in [citation needed] and explained in Section 5.3 by also calculating the perplexity of *alternative* answers to each question.

That is, we take the result of applying each model to both the answer with and without counterparametric context, and we calculate the perplexity scores of getting both the parametric and counterparametric answer to each one of these. This produces four different scores which are detailed in Figure 1: one for each answer using either empty and counterparametric context.

By definition, the tokens of the parametric answer p_1, \dots, p_N are the ones corresponding to the lowest perplexity answer for the query without any context. This is not the case for the tokens of the counterparametric answer $\bar{p}_1, \dots, \bar{p}_{\bar{N}}$, which produces the inequality in Equation (2).

$$\text{PPL}(p_1, \dots, p_N \mid Q) \leq \text{PPL}(\bar{p}_1, \dots, \bar{p}_{\bar{N}} \mid Q) \quad (2)$$

Finding the result of the inequality for the queries with the counterparametric context W is one of the main goals of this research. In fact, we know that if the perplexity of the parametric tokens p_1, \dots, p_N is greater than the tokens for the counterparametric answer $\bar{p}_1, \dots, \bar{p}_{\bar{N}}$ then the answer was memorised. Otherwise, the answer was generated in-context.

$$\text{Answer Source} = \begin{cases} \text{Memory} & \text{if } P(p_1, \dots, p_N \mid W) < P(\bar{p}_1, \dots, \bar{p}_{\bar{N}} \mid W) \\ \text{Context} & \text{otherwise} \end{cases} \quad (3)$$

*I am finding it hard to explain this subsection. Maybe I should add pseudocode here.

Base Question	Parametric Answer	Counterparametric Answer	Question with counterparametric context
What is the date of birth of Che Guevara?	June 14, 1928	June 21, 1947	Context: [the date of birth of Che Guevara is June 21, 1947]. Q: What is the date of birth of Che Guevara? A: The date of birth of Che Guevara is
What is the date of birth of Ibn al-Haytham?	965 AD	June 14, 1928	Context: [the date of birth of Ibn al-Haytham is June 14, 1928]. Q: What is the date of birth of Ibn al-Haytham? A: The date of birth of Ibn al-Haytham is
What is the date of birth of Boyan Slat?	27 January 1994	February 23, 1868	Context: [the date of birth of Boyan Slat is February 23, 1868]. Q: What is the date of birth of Boyan Slat? A: The date of birth of Boyan Slat is
What is the date of birth of W.E.B Du Bois?	February 23, 1868	June 14, 1928	Context: [the date of birth of W.E.B Du Bois is June 14, 1928]. Q: What is the date of birth of W.E.B Du Bois? A: The date of birth of W.E.B Du Bois is
What is the date of birth of Stephen Hawking?	January 8, 1942	965 AD	Context: [the date of birth of Stephen Hawking is 965 AD]. Q: What is the date of birth of Stephen Hawking? A: The date of birth of Stephen Hawking is
What is the date of birth of Shirin Ebadi?	June 21, 1947	June 14, 1928	Context: [the date of birth of Shirin Ebadi is June 14, 1928]. Q: What is the date of birth of Shirin Ebadi? A: The date of birth of Shirin Ebadi is

Table 3: Example of the sampling done to produce counterparametric answers. Counterparametric answers are generated by sampling a random answer from the parametric answers from the same base questions; to ensure that no parametric and counterparametric pair are identical, we only sample between different parametric answers. Note that the same parametric answer can appear several times as a counterparametric in different questions.

5.6 Comparing the Final Answers

There is a third case that’s not present in Equations (2) and (3): the case where the answer comes from neither the model’s memory nor the query’s context, but that instead the model generates a third answer combining both.

There are several cases where this can happen. The most interesting are explained in ??, while the full results can be found in Appendix B.

In particular, we categorise the final answers in one of three groups depending on whether the answer with minimal perplexity on the query with the counterfactual context W is equal to the parametric answer, to the counterparametric answer, or to something else.

$$\text{Group} = \begin{cases} \text{Parametric} & \text{if } (\nexists x_1, \dots, x_N) \text{ PPL}(x_1, \dots, x_N | W) < A \\ \text{Counterparametric} & \text{if } (\nexists x_1, \dots, x_N) \text{ PPL}(x_1, \dots, x_N | W) < B \\ \text{Other} & \text{otherwise} \end{cases} \quad (4)$$

where

$$\begin{aligned} A &= \text{PPL}(p_1, \dots, p_N | W) \\ B &= \text{PPL}(\bar{p}_1, \dots, \bar{p}_{\bar{N}} | W) \end{aligned}$$

There is a correlation between Equation (4) and Equation (3): an answer in the Parametric group will come from the model’s memory, and an answer in the Counterparametric group will come from the query’s (counterparametric) context.

6 Results

Some results I want to show.

- Larger models tend to prefer parametric knowledge over contextual knowledge.
 - This is the case in “Characterizing Mechanisms for Factual Recall in Language Models” Yu et al. (2023), but I’m proving this on a larger set of question.
 - This is using exact match. Maybe attempting Unigram F_1 would produce interesting results Petroni et al. (2021).
- How this compares between Decoder-only models, Seq2Seq models, and Retrieval-Augmented Language Models.
- How does the perplexity between parametric answers and contextual answers compare within the same model.
 - From the perplexity alone, can we predict whether an answer came from the model’s memory or from the context?
 - It might be worth experimenting this with factual answers in the context, to simulate a RAG-difference detector.
- Is there any correlation between the perplexity of the parametric and contextual answer *without any context* and which one will be chosen when adding context?
 - This one is interesting, but I’m not sure we’ll get significative results.
- Interesting “*Other*” results.
- **Anything else?**

Appendices

A Questions and objects used to form the queries

What is the date of birth of {person}? The date of birth of {person} is
In what city was {person} born? {person} was born in
What is the date of death of {person}? The date of death of {person} is
What is the primary profession of {person}? The primary profession of {person} is
What is {person} primarily known for? {person} is primarily known for
What's the main nationality of {person}? {person} is
What educational institution did {person} attend? {person} attended

What country is {city} in? {city} is in
What's the highest administrative subdivision {city} is part of? {city} is part of
In what year was {city} founded? {city} was founded in
What major river is nearest to {city}? The nearest major river to {city} is
What is the time zone of {city}? The time zone of {city} is
What is the current population of {city}? The current population of {city} is
What is the altitude of {city} above sea level? {city} is at an altitude of

Who is credited with the discovery of {principle}? {principle} was discovered by
Which scientific discipline encompasses {principle}? {principle} is encompassed by
What is the primary application of {principle}? The primary application of {principle} is
In which year was {principle} first formulated? {principle} was first formulated in
What is the SI unit most commonly associated with {principle}? The SI unit most commonly associated with {principle} is

What's the chemical formula for {element}? The chemical formula for {element} is
When was {element} first isolated? {element} was first isolated in
What's the atomic number of {element}? The atomic number of {element} is
What is the melting point of {element}? The melting point of {element} is
In which group of the periodic table is {element} found? {element} is found in group

What genre does {book} belong to? The genre of {book} is
Who's the author of {book}? {book} was written by
In what year was {book} first published? {book} was first published in
How many pages are in the original publication of {book}? The original publication of {book} has
What is the name of the main protagonist in {book}? The main protagonist in {book} is

Who painted {painting}? {painting} was painted by
When was {painting} completed? {painting} was completed in
What artistic movement does {painting} belong to? {painting} belongs to
What materials were used to create {painting}? {painting} was created with
Where is {painting} primarily housed? {painting} is currently in
What are the dimensions of {painting}? The dimensions of {painting} are
In which museum was {painting} first exhibited? {painting} was first exhibited in

What year did {historical_event} happen? {historical_event} happened in the year
Who was the primary leader associated with {historical_event}? The primary leader associated with {historical_event} was
What was the duration of {historical_event}? {historical_event} lasted for
