# 1 Introduction and Objectives

## 1.1 Problem Background

In recent years, Large Language Models (LLMs) have become ubiquitous in solving general problems across a wide range of tasks, from text generation to question answering and logic problems. However, recent research suggests that using these models alone might not be the most effective way to solve problems that are not directly related to text generation (Yao et al. 2023).

One approach to improving the performance on knowledge problems for LLMs is Retrieval-Augmented Generation (RAG) (Lewis et al. 2020). RAG involves retrieving relevant context related to a query and incorporating it into the model’s input, enhancing the model’s ability to generate accurate and contextually appropriate responses.

As RAG-enhanced systems become more widespread, studies on the performance of different retrieval systems and their interaction with LLMs have become crucial. Many explore the performance of these downstream tasks depending on both the retriever and the generator (Ghader et al. 2023, Brown et al. 2020), examining whether the knowledge is *grounded* in the context. Retrieval-Augmented models, such as ATLAS (Izacard et al. 2022) and RETRO (Borgeaud et al. 2022), use this approach to fine-tune a model on both a large body of knowledge and an existing index for context retrieval.

This project aims to understand the performance of various LLMs by measuring their *knowledge grounding* on a dataset consisting of a large variety of questions across a wide range of topics. We follow the approach by Yu et al. of running queries with counterfactual context to understand whether a particular answer originates from the model’s inherent knowledge (i.e., its training data) or from the provided context (i.e., the context retrieved by RAG).

This thesis builds on this knowledge and improve our understanding of how different LLMs interact with the given context in the problem of question answering. Specifically, we investigate whether these interactions vary depending on the type of question being answered, contributing to a more nuanced understanding of LLM performance in diverse knowledge domains.

## 1.2 Thesis Questions & Objectives

This thesis is structured around three different objectives to deepen our understanding knowledge grounding in large language models.

### 1.2.1 Creating a representative dataset of questions

The research of this thesis requires a large dataset of questions from a variety of categories to test large language models. In order to understand knowledge grounding in these models, we require a dataset with the following properties.

1. The dataset must contain questions that have short, unambiguous answers.
2. The questions must cover a large set of topics.
3. It must allow for the creation of counterfactual answers in the same format as correct ones to test contextual versus inherent knowledge.

The existing literature uses various existing question-and-answer datasets, none of which are useful for this research.\*

**Natural Questions Dataset** Created by Google Research (Kwiatkowski et al. 2019), and commonly used in research related to understanding the answers of LLMs in question-and-answer problems (Hsia et al. 2024, Mallen et al. 2023, Ghader et al. 2023). While the dataset provides an excellent range of questions and existing literature to compare these results to, the lack of categorisation is an obstacle in our objective to generate counterfactual answers.

**Human-Augmented Dataset** Sometimes used in research related to quality control of large language models (Kaushik et al. 2020). However, the high cost associated with this dataset would limit the size of our questions.

**Countries’ Capitals Question Dataset** Used in “Characterizing Mechanisms for Factual Recall in Language Models” (Yu et al. 2023), this dataset contains a single question about the capital city of certain countries which can be easily transformed to a counterfactual question. This format is ideal for the research done in this thesis, but having a single question pattern will not allow a deep dive into the source of each answer in a general question.

Instead of using an existing dataset, this research takes inspiration from the paper by Yu et al. to create a similar but larger dataset of questions and answers from a wide range of topics, where questions can be grouped by question pattern to ensure that their formats are similar. This way, we can emulate the approach of that paper of using the answer from a certain question as the counterfactual of another.

This dataset will be used to test the remaining questions of this thesis. Since it might be useful for future research, it will also be presented as its own result.

---

\*TODO: Maybe this entire subsection should go on Section 2 or Section 3.

### 1.2.2 When does a model choose the provided context knowledge over its inherent knowledge?

Currently, little is understood about the factors and mechanisms that control whether an LLM will generate text respecting either the context or the memorised information.

Previous research found out that, when the context of a query contradicts the ground knowledge of a model, the answer picked depends on the type and size of the model used (Yu et al. 2023).

This thesis extends this research by testing the representative set of questions and counterfactuals described in the previous section with both Seq2Seq and Decoder-only models of various sizes. We also research the cases when the answer doesn't correspond to either the parametric or contextual knowledge, and why the model chooses a third type of answer when adding counterfactual context.

This thesis also gathers insights from answering this question on different categories and patterns of questions to find out if this depends on what is being asked.

### 1.2.3 Can we use the perplexity score of an answer to predict whether it came from inherent or contextual knowledge?

Yu et al. showed that there is a correlation between the probability of a large language model choosing a parametric answer over a counterfactual contextual answer and the amount of times this answer appears in the ground truth data of the model. This gives us clues on whether the result of a query came from parametric or contextual knowledge if we have access to this ground truth, as is the case in models like Pythia (Biderman et al. 2023).

Unfortunately, most so-called open-source large language models do not give us access to the source data being used to train it and therefore do not allow this kind of analysis.

The **perplexity** score of answer gives a measure of how “certain” a large language model is of its answer (Jiang et al. 2021). We hypothesise that we can use this metric to serve as a reliable indicator of whether a particular answer was memorised by the LLM or was derived from the provided context.

## 2 Context

This research is the latest on a long line of academic articles on the topics of retrieval-augmented generation, counterparametric and contextual data, and how to enhance knowledge on large language models.

This section presents a short summary of some of the articles that were useful in researching this topic.

### 2.1 Foundational Papers on Large Language Models

- “Language models are unsupervised multitask learners” (Radford et al. 2019).
  - The foundational paper for GPT2.
- “Exploring the Limits of Transfer Learning with a Unified Text-to-Text Transformer” (Raffel et al. 2020).
  - The foundational paper for T5.
- “Language Models are Few-shot Learners” (Brown et al. 2020).
  - Introduces “in-context learning”.
- “Prompt programming for large language models: Beyond the few-shot paradigm” (Reynolds & McDonell 2021).
  - Improves the previous paper.

### 2.2 Papers working with RAG and contextual data

- “Retrieval-Augmented Generation for Knowledge-Intensive NLP Tasks” (Lewis et al. 2020).
  - Foundational paper for RAG.
- “Self-RAG: Learning to Retrieve, Generate, and Critique through Self-Reflection” (Asai et al. 2023).
  - Interesting RAG system.
- “Can Retriever-Augmented Language Models Reason? The Blame Game Between the Retriever and the Language Model” (Ghader et al. 2023).
  - Nice evaluation of RAG models.

### 2.3 Retrieval-Augmented Language Models

- “Shall We Pretrain Autoregressive Language Models with Retrieval? A Comprehensive Study” (Wang et al. 2023).

---

\*This entire section is in progress — short summaries of the named papers will come soon.

- Reproduces and pretrains RETRO.
- “Atlas: Few-shot Learning with Retrieval Augmented Language Models” (Izcard et al. 2022).
  - Introduces ATLAS.
- “Improving language models by retrieving from trillions of tokens” (Borgeaud et al. 2022).
- “RAGGED: Towards Informed Design of Retrieval Augmented Generation Systems” (Hsia et al. 2024).
  - Analyses results of these systems; compares Llama to Flan-T5.

## 2.4 On disentangling parametric and context-augmented counterparametric knowledge

- “DISCO: Distilling Counterfactuals with Large Language Models” (Chen et al. 2023).
  - Does similar analysis with counterfactuals to this thesis
- “DisentQA: Disentangling Parametric and Contextual Knowledge with Counterfactual Question Answering” (Neeman et al. 2022).
  - Also does a similar analysis to this thesis.
- “Characterizing Mechanisms for Factual Recall in Language Models” (Yu et al. 2023).
  - Very simple analysis, but tries to understand WHERE in the model the contextual answers come from.
- “Can We Edit Factual Knowledge by In-Context Learning?” (Zheng et al. 2023).
- “Learning the Difference that Makes a Difference with Counterfactually-Augmented Data” (Kaushik et al. 2020).

### 3 Methods

#### 3.1 Creating a representative dataset of questions

As argued in Section 1.2.1, our codebase requires the creation of a new dataset of questions with three main properties.

1. The questions should have short and unambiguous answers.
2. They must cover a large set of topics, eras, and places.
3. They must allow for the creation of sensible counterfactuals by having sets of questions with the same answer format.

To address these items, we follow the approach done by Yu et al. in creating base questions that refer to a specific object, so all the answers for the same base question have a similar format and creating counterfactual answers is easy.

Since this thesis requires a set of questions that covers a large set of topics, eras, and places, we enhance this method by creating a set of categories, each of which has a large set of base questions and another set of objects that can be matched. An example of this approach is shown in Table 1.

Category	Base Questions	Object	Queries
Person	Q: What is the date of birth of <code>{person}</code> ? A: The date of birth of <code>{person}</code> is Q: In what city was <code>{person}</code> born? A: <code>{person}</code> was born in	Che Guevara Confucius	Q: What is the date of birth of Che Guevara? A: The date of birth of Che Guevara is Q: What is the date of birth of Confucius? A: The date of birth of Confucius is Q: In what city was Che Guevara born? A: Che Guevara was born in Q: In what city was Confucius born? A: Confucius was born in
City	Q: What country is <code>{city}</code> in? A: <code>{city}</code> is in	Cairo Mumbai Buenos Aires London	Q: What country is Cairo in? A: Cairo is in Q: What country is Mumbai in? A: Mumbai is in Q: What country is Buenos Aires in? A: Buenos Aires is in Q: What country is London in? A: London is in

**Table 1:** Some examples of the base-question and object generation that are fed to the models for finding parametric answers.

This list of questions will enable the research on whether the answers given by large language models depend on the category and the format of the questions.

## 3.2 When does a model choose the provided context knowledge over its inherent knowledge?

### 3.2.1 Model Selection

In order to get a general understanding of large language models with added context, we test the queries generated in Section 3.1 into four models of different types and sizes.

	Seq2Seq Model	Decoder-Only Model
<b>Small</b>	Flan-T5-XL	Meta-Llama-3.1-8B-Instruct
<b>Large</b>	Flan-T5-XXL	Meta-Llama-3.1-70B-Instruct

**Table 2:** The four large language models chosen for this research.

The Flan-T5 models (Chung et al. 2022) are an extension to the original Seq2Seq T5 models (Raffel et al. 2020) which are fine-tuned to particular NLP tasks framed as text-to-text problems. Compared to T5, it’s generally better at following instructions and has improved zero-shot performance.

The Llama models (Dubey et al. 2024) are Decoder-only models with a dense transformer architecture that are fine-tuned for instruction-following tasks, and are specially adept at complex prompts.

### 3.2.2 What type of answer does each model select for each question?

The first step to understanding the knowledge grounding of large language models is to create queries that contain counterparametric data as part of the context. By comparing the result to the existing answers it becomes trivial to understand whether an answer came from the model’s memory, the queries’ context, or neither of these.

Following the approach of Yu et al., for every query we randomly sample from the set of answers of the same base question for answers that are different to the parametric answer (given by the original query). Later, we add this “counterfactual” answer to the context, to form a new query and query the same model again.

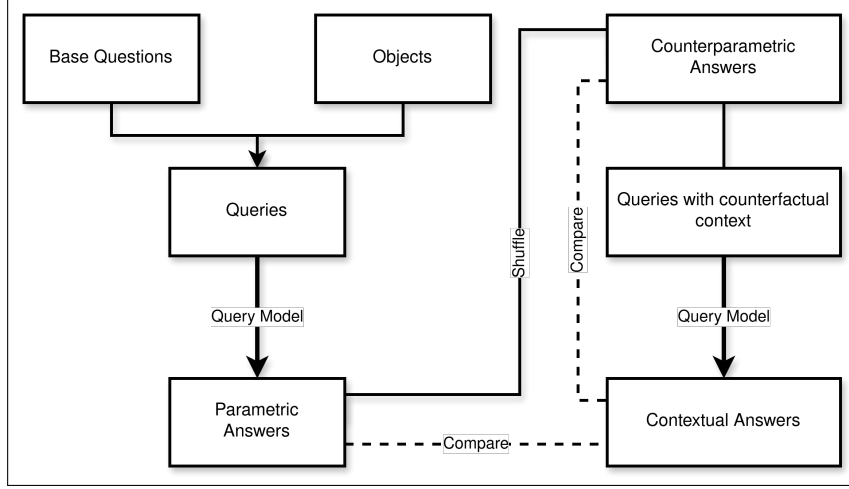

To ensure that the results are simple to interpret and minimise the effect of randomness, once we select the queries we follow the example of Hsia et al. and use Greedy Decoding to find the answer.

We compare the parametric answer to the previous values to come to one of three cases: either this answer is identical to the **Parametric** answer and the model inferred it from its grounded knowledge, to the **Counterparametric** answer and the model inferred it from the context, or the answer is different to these two and the model inferred it from some **Other** place.

This approach is detailed in Figure 1, and Table 3 contains an example of the shuffling done for this experiment.

Base Question	Object	Parametric Answer	Counterparametric Answer	Question with counterparametric context
Q: What is the date of birth of {person}? A: The date of birth of {person} is	Che Guevara	June 14, 1928	965 AD	Context: [the date of birth of Che Guevara is 965 AD]. Q: What is the date of birth of Che Guevara? A: The date of birth of Che Guevara is
	Ibn al-Haytham	965 AD	June 14, 1928	Context: [the date of birth of Ibn al-Haytham is June 14, 1928]. Q: What is the date of birth of Ibn al-Haytham? A: The date of birth of Ibn al-Haytham is
	Boyan Slat	27 January 1994	February 23, 1868	Context: [the date of birth of Boyan Slat is February 23, 1868]. Q: What is the date of birth of Boyan Slat? A: The date of birth of Boyan Slat is
	W.E.B Du Bois	February 23, 1868	June 14, 1928	Context: [the date of birth of W.E.B Du Bois is June 14, 1928]. Q: What is the date of birth of W.E.B Du Bois? A: The date of birth of W.E.B Du Bois is
Q: What country is {city} in? A: {city} is in	Cairo	Egypt	India	Context: [Cairo is in India]. Q: What country is Cairo in? A: Cairo is in
	Mumbai	India	Egypt	Context: [Mumbai is in Egypt]. Q: What country is Mumbai in? A: Mumbai is in

**Table 3:** Using the same question format allows us to repurpose previous parametric answers as counterparametric ones.

**Figure 1:** Example diagram of steps used to calculate the two sets of answers, *parametric* and *contextual*, and to compare them to answer the question in this objective. Many of the terms in this diagram are explained in the Glossary.

### 3.3 Can we use the perplexity score of an answer to predict whether it came from inherent or contextual knowledge?

#### 3.3.1 Perplexity Score

The Perplexity score of an answer is normally used to measure the inverse of the certainty that the model has of a particular answer (Brown et al. 2020, Borgeaud et al. 2022). In a sense, it’s the “surprise” of a model that a certain answer is correct.

We can define the probability of a model choosing a token  $x_n$  with context  $x_1, \dots, x_{n-1}$  from a query  $Q$  by calculating the softmax value of all the logits for the possible words for this token.

The probabilities of the tokens if an answer can be accumulated to calculate the negative log-likelihood NLL, which is used to calculate the perplexity PPL using the formulas from Equations (1) and (2).

$$\text{NLL}(x_1, \dots, x_n | Q) = -\frac{1}{n} \sum_{i=1}^n \log_2 P(x_i | Q, x_1, \dots, x_{i-1}) \quad (1)$$

$$\text{PPL}(x_1, \dots, x_n | Q) = 2^{\text{NLL}(x_1, \dots, x_n | Q)} \quad (2)$$

### 3.3.2 Perplexity of the parametric answer with counterfactual context and vice-versa

Note that the token  $x_n$  does not necessarily have to be the result of applying the query  $x_1, \dots, x_{n-1}$  to a model.

Therefore, it becomes necessary to use teacher-forcing (Lamb et al. 2016) to feed some answer to the model regardless of what's the answer to this particular query. This allows us to calculate the perplexity scores of the parametric answers for both the regular query and the one with counterfactual context, and the perplexity scores of the contextual answers for these two queries.

For a given parametric answer  $p_1, \dots, p_n$  and randomly sampled counterparametric answer  $q_1, \dots, q_m$ , a query without context  $Q$ , and a query with this counterparametric context  $Q'$  we can calculate four different perplexity scores as shown in Table 4.

		Tokens	
		Parametric $p$	Counterparametric $q$
Context	Regular Query	$P_0 = \text{PPL}(p_1, \dots, p_n \mid Q)$	$P_1 = \text{PPL}(q_1, \dots, q_m \mid Q)$
	Using counterfactual context	$P_2 = \text{PPL}(p_1, \dots, p_n \mid Q')$	$P_3 = \text{PPL}(q_1, \dots, q_m \mid Q')$

**Table 4:** Four different perplexity values: one for each set of tokens, and one for each query context.

Since the parametric answer is by definition the response of the model to the regular query,  $P_0 \leq P_1$ . In fact, the perplexity of the parametric value is lower than the perplexity of any other answer on query  $Q$ .

The question in Section 3.2 is equivalent to asking whether  $P_2 \stackrel{\leq}{\geq} P_3$ , or whether there is a different sequence of tokens that has any lower perplexity of these two.

### 3.3.3 Predicting whether an answer came from memory or from context

One question remains: if the response of the query with counterfactual context  $Q'$  is  $x_1, \dots, x_n$ , how can we predict whether this answer is came from the model's memory  $p$ , from the given context  $q$ , or something else?

We propose investigating the value of the perplexity  $\text{PPL}(x_1, \dots, x_n \mid Q')$  and comparing it to the distribution of perplexities on parametric and contextual answers. TODO: Maybe include a KDE or a K-S test here.

## 4 Results

## 5 Results (old)

Some results I want to show.

- Larger models tend to prefer parametric knowledge over contextual knowledge.
  - This is the case in “Characterizing Mechanisms for Factual Recall in Language Models” (Yu et al. 2023), but I’m proving this on a larger set of question.
  - This is using exact match. Maybe attempting Unigram  $F_1$  would produce interesting results (Petroni et al. 2021).
- How this compares between Decoder-only models, Seq2Seq models, and Retrieval-Augmented Language Models.
- How does the perplexity between parametric answers and contextual answers compare within the same model.
  - From the perplexity alone, can we predict whether an answer came from the model’s memory or from the context?
  - It might be worth experimenting this with factual answers in the context, to simulate a RAG-difference detector.
- Is there any correlation between the perplexity of the parametric and contextual answer *without any context* and which one will be chosen when adding context?
  - This one is interesting, but I’m not sure we’ll get significant results.
- Interesting “Other” results.
- Anything else?

### 5.1 Comparing the amounts of each type of answer

**Figure 2:** Amount of entries for each result after applying counterfactual context to Llama models. Generally, larger models tend to prefer parametric to contextual knowledge; this is further discussed in Section 6.2.

**Figure 3:** Same results for the Seq2Seq models FLAN-T5. While these models tend to be more biased towards contextual knowledge, as discussed in Section 6.1, larger models still are biased towards parametric knowledge.

## 5.2 Comparing the perplexity distribution for each type of answer

**Figure 4:** Perplexity box plots for Decoder-only Llama models.

Despite the amount for small and large Llama models being considerably different, the average values and distributions remain roughly the same. This is discussed in Section 6.

Additionally, the perplexity of contextual answers is considerably lower than the one for parametric answers.

Interestingly, the larger models tend to have a much lower perplexity for both parametric and contextual answers.

**Figure 5:** Perplexity box plots for Seq2Seq Flan models.

## 6 Discussion

6.1 Model type and memorised knowledge

6.2 Model size and memorised knowledge

6.3 Differences in perplexity scores for larger and smaller models

6.3.1 Can we use this to predict from where an answer came from?

6.4 Differences in distributions for different categories and questions.

# Appendices

## A Questions and objects used to form the queries

What is the date of birth of {person}? The date of birth of {person} is  
In what city was {person} born? {person} was born in  
What is the date of death of {person}? The date of death of {person} is  
What is the primary profession of {person}? The primary profession of {person} is  
What is {person} primarily known for? {person} is primarily known for  
What's the main nationality of {person}? {person} is  
What educational institution did {person} attend? {person} attended  
What was the native language of {person}? The native language of {person} was  
Who was {person}'s most influential mentor? The most influential mentor of {person} was  
What was {person}'s religious affiliation? The religious affiliation of {person} was  
What was {person}'s primary field of study? The primary field of study of {person} was  
What was {person}'s most famous work or invention? The most famous work or invention of {person} was  
What historical period did {person} live in? {person} lived during the  
What was {person}'s family's social class? {person}'s family belonged to the  
What was {person}'s political ideology? The political ideology of {person} was  
What was {person}'s preferred artistic or scientific medium? The preferred medium of {person} was  
What was {person}'s cultural background? The cultural background of {person} was

What country is {city} in? {city} is in  
What's the highest administrative subdivision {city} is part of? {city} is part of  
In what year was {city} founded? {city} was founded in  
What major river is nearest to {city}? The nearest major river to {city} is  
What is the time zone of {city}? The time zone of {city} is  
What is the current population of {city}? The current population of {city} is  
What is the altitude of {city} above sea level? {city} is at an altitude of  
What is the primary language spoken in {city}? The primary language spoken in {city} is  
What is the predominant architectural style in {city}? The predominant architectural style in {city} is  
What is the main economic industry of {city}? The main economic industry of {city} is  
What is the average annual temperature in {city}? The average annual temperature in {city} is  
What is the nearest major body of water to {city}? The nearest major body of water to {city} is  
What is the most famous landmark in {city}? The most famous landmark in {city} is  
What is the primary mode of public transportation in {city}? The primary mode of public transportation in {city} is  
What is the name of the airport serving {city}? The airport serving {city} is  
What is the sister city of {city}? The sister city of {city} is  
What is the traditional cuisine {city} is known for? The traditional cuisine {city} is known for is

Who is credited with the discovery of {principle}? {principle} was discovered by  
Which scientific discipline encompasses {principle}? {principle} is encompassed by  
What is the primary application of {principle}? The primary application of {principle} is  
In which year was {principle} first formulated? {principle} was first formulated in  
What is the SI unit most commonly associated with {principle}? The SI unit most commonly associated with {principle} is

What's the chemical formula for {element}? The chemical formula for {element} is  
When was {element} first isolated? {element} was first isolated in  
What's the atomic number of {element}? The atomic number of {element} is  
What is the melting point of {element}? The melting point of {element} is  
In which group of the periodic table is {element} found? {element} is found in group  
What's the standard atomic weight of {element}? The standard atomic weight of {element} is  
What's the electron configuration of {element}? The electron configuration of {element} is  
What's the most common oxidation state of {element}? The most common oxidation state of {element} is  
What's the crystal structure of {element} at room temperature? The crystal structure of {element} at room temperature is  
What's the primary isotope of {element}? The primary isotope of {element} is  
What's the electronegativity value of {element}? The electronegativity value of {element} is  
What's the ionization energy of {element}? The ionization energy of {element} is  
What's the atomic radius of {element}? The atomic radius of {element} is  
What's the boiling point of {element}? The boiling point of {element} is  
In which period of the periodic table is {element} located? {element} is located in period

What genre does {book} belong to? The genre of {book} is  
Who's the author of {book}? {book} was written by  
In what year was {book} first published? {book} was first published in  
How many pages are in the original publication of {book}? The original publication of {book} has  
What is the name of the main protagonist in {book}? The main protagonist in {book} is

What is the original language of {book}? The original language of {book} is  
Who is the original publisher of {book}? The publisher of {book} is  
What is the highest award {book} won? The highest award won by {book} is  
What is the opening line of {book}? The opening line of {book} is  
How many chapters are in {book}? {book} has  
How many pages are in {book}? {book} has

Who painted {painting}? {painting} was painted by

```

When was {painting} completed? {painting} was completed in
What artistic movement does {painting} belong to? {painting} belongs to
What materials were used to create {painting}? {painting} was created with
Where is {painting} primarily housed? {painting} is currently in
What are the dimensions of {painting}? The dimensions of {painting} are
In which museum was {painting} first exhibited? {painting} was first exhibited in
What is the dominant color in {painting}? The dominant color in {painting} is
Who commissioned {painting}? {painting} was commissioned by
What is the estimated value of {painting}? The estimated value of {painting} is
What is the subject matter of {painting}? The subject matter of {painting} is
In which country was {painting} created? {painting} was created in

What year did {historical_event} happen? {historical_event} happened in the year
Who was the primary leader associated with {historical_event}? The primary leader associated with
{historical_event} was
What was the duration of {historical_event}? {historical_event} lasted for
In which country did {historical_event} primarily take place? {historical_event} primarily took place in

What is the height of {building}? The height of {building} is
Who was the main architect of {building}? The main architect of {building} was
In which year was {building} completed? {building} was completed in
In which city is {building} located? {building} is located in
What architectural style is {building}? The architectural style of {building} is
How many floors does {building} have? {building} has
What is the primary construction material of {building}? The primary construction material of {building} is
What is the total floor area of {building}? The total floor area of {building} is
How long did it take to construct {building}? The construction of {building} took

Who composed {composition}? {composition} was composed by
In what year was {composition} first performed? {composition} was first performed in
What is the musical genre of {composition}? The musical genre of {composition} is
What is the opus number of {composition}? The opus number of {composition} is
What is the key signature of {composition}? The key signature of {composition} is
How many movements does {composition} have? {composition} has
What is the tempo marking of {composition}? The tempo marking of {composition} is
What is the duration of {composition}? The duration of {composition} is
For which instrument(s) was {composition} written? {composition} was written for
In which city was {composition} premiered? {composition} was premiered in

```

**Listing 1:** All base questions used in this work. Each one of these will get combined with data from Listing 2 as detailed in ??.

```

Ada Lovelace, person
Alan Turing, person
Albert Einstein, person
Alexander Fleming, person
Aristotle, person
Billie Jean King, person
Boyan Slat, person
Catherine the Great, person
Che Guevara, person
Cleopatra, person
Confucius, person
Ernest Rutherford, person
Florence Nightingale, person
Freddie Mercury, person
Frida Kahlo, person
Greta Thunberg, person
Harriet Tubman, person
Ibn al-Haytham, person
Isaac Newton, person
Karl Marx, person
Leonardo da Vinci, person
Mahatma Gandhi, person
Malala Yousafzai, person
Mansa Musa, person
Marie Curie, person
Martin Luther King Jr., person
Michelangelo, person
Mohandas Gandhi, person
Mozart, person
Muhammad Ali, person
Neil Armstrong, person
Nelson Mandela, person
Nikola Tesla, person
Pablo Picasso, person
Rosalind Franklin, person
Shirin Ebadi, person
Simon Bolivar, person
Srinivasa Ramanujan, person
Stephen Hawking, person

```

Sun Yat-sen, person  
 Virginia Woolf, person  
 Vladimir Lenin, person  
 Wangari Maathai, person  
 W.E.B. Du Bois, person  
 William Shakespeare, person  
 Wu Zetian, person  
 Yuri Gagarin, person  
 Amelia Earhart, person  
 Galileo Galilei, person  
 Genghis Khan, person  
 Joan of Arc, person  
 Lise Meitner, person  
 Marcus Aurelius, person  
 Maya Angelou, person  
 Queen Nzinga, person  
 Socrates, person  
 Voltaire, person  
 Alexandria, city  
 Amsterdam, city  
 Antananarivo, city  
 Athens, city  
 Baghdad, city  
 Berlin, city  
 Buenos Aires, city  
 Bukhara, city  
 Cairo, city  
 Cape Town, city  
 Cartagena, city  
 Chicago, city  
 Cusco, city  
 Cuzco, city  
 Delhi, city  
 Dubrovnik, city  
 Fez, city  
 Havana, city  
 Istanbul, city  
 Jerusalem, city  
 Kyoto, city  
 La Paz, city  
 Lhasa, city  
 Lisbon, city  
 London, city  
 Luang Prabang, city  
 Marrakech, city  
 Mexico City, city  
 Montevideo, city  
 Moscow, city  
 Mumbai, city  
 Muscat, city  
 New York, city  
 Nur-Sultan, city  
 Paris, city  
 Petra, city  
 Prague, city  
 Quebec City, city  
 Reykjavik, city  
 Rome, city  
 Sao Paulo, city  
 Sarajevo, city  
 Shanghai, city  
 Singapore, city  
 St. Petersburg, city  
 Sydney, city  
 Tbilisi, city  
 Tenochtitlan, city  
 Thimphu, city  
 Timbuktu, city  
 Tokyo, city  
 Ulaanbaatar, city  
 Varanasi, city  
 Venice, city  
 Vienna, city  
 Wellington, city  
 Windhoek, city  
 Xi'an, city  
 Yogyakarta, city  
 Zanzibar City, city  
 Addis Ababa, city

 Dubai, city  
 Helsinki, city  
 Machu Picchu, city

Nairobi,city  
 Rio de Janeiro,city  
 Samarkand,city  
 Toronto,city  
 Yangon,city  
 Archimedes' Principle,principle  
 Bernoulli's Principle,principle  
 Boyle's Law,principle  
 Cell Theory,principle  
 Conservation of Energy,principle  
 DNA Replication,principle  
 Electromagnetism,principle  
 Entropy,principle  
 Evolution by Natural Selection,principle  
 Evolution,principle  
 General Relativity,principle  
 Germ Theory of Disease,principle  
 Gravity,principle  
 Hardy-Weinberg Principle,principle  
 Heliocentrism,principle  
 Hubble's Law,principle  
 Kepler's Laws of Planetary Motion,principle  
 Le Chatelier's Principle,principle  
 Mendel's Laws of Inheritance,principle  
 Newton's Laws of Motion,principle  
 Pauli Exclusion Principle,principle  
 Periodic Law,principle  
 Photosynthesis,principle  
 Plate Tectonics,principle  
 Principle of Least Action,principle  
 Quantum Mechanics,principle  
 Relativity,principle  
 Superconductivity,principle  
 Thermodynamics,principle  
 Uncertainty Principle,principle  
 Avogadro's Law,principle  
 Coulomb's Law,principle  
 Faraday's Laws of Electrolysis,principle  
 Heisenberg Uncertainty Principle,principle  
 Ohm's Law,principle  
 Schrödinger Equation,principle  
 Special Relativity,principle  
 Aluminum,element  
 Barium,element  
 Bismuth,element  
 Bromine,element  
 Calcium,element  
 Carbon,element  
 Chlorine,element  
 Chromium,element  
 Copper,element  
 Gold,element  
 Helium,element  
 Hydrogen,element  
 Iodine,element  
 Iron,element  
 Lead,element  
 Lithium,element  
 Magnesium,element  
 Manganese,element  
 Mercury,element  
 Neon,element  
 Nitrogen,element  
 Oxygen,element  
 Phosphorus,element  
 Plutonium,element  
 Potassium,element  
 Radon,element  
 Silicon,element  
 Silver,element  
 Sodium,element  
 Sulfur,element  
 Thorium,element  
 Tin,element  
 Titanium,element  
 Uranium,element  
 Zinc,element  
 Argon,element  
 Boron,element  
 Cobalt,element  
 Fluorine,element  
 Gallium,element  
 Krypton,element

Nickel,element  
 Xenon,element  
 1984,book  
 Anna Karenina,book  
 Beloved,book  
 Brave New World,book  
 Catch-22,book  
 Crime and Punishment,book  
 Don Quixote,book  
 Fahrenheit 451,book  
 Frankenstein,book  
 Jane Eyre,book  
 Midnight's Children,book  
 Moby-Dick,book  
 One Flew Over the Cuckoo's Nest,book  
 One Hundred Years of Solitude,book  
 Pride and Prejudice,book  
 Slaughterhouse-Five,book  
 The Alchemist,book  
 The Art of War,book  
 The Book Thief,book  
 The Brothers Karamazov,book  
 The Catcher in the Rye,book  
 The Chronicles of Narnia,book  
 The Color Purple,book  
 The Count of Monte Cristo,book  
 The Grapes of Wrath,book  
 The Great Gatsby,book  
 The Handmaid's Tale,book  
 The Hitchhiker's Guide to the Galaxy,book  
 The Hobbit,book  
 The Hunger Games,book  
 The Kite Runner,book  
 The Little Prince,book  
 The Lord of the Rings,book  
 The Metamorphosis,book  
 The Name of the Rose,book  
 The Odyssey,book  
 The Picture of Dorian Gray,book  
 The Pillars of the Earth,book  
 The Stranger,book  
 The Sun Also Rises,book  
 The Wind-Up Bird Chronicle,book  
 To Kill a Mockingbird,book  
 Ulysses,book  
 War and Peace,book  
 Wuthering Heights,book  
 The Iliad,book  
 The Tale of Genji,book  
 Things Fall Apart,book  
 To the Lighthouse,book  
 American Gothic,painting  
 Christina's World,painting  
 Girl with a Pearl Earring,painting  
 Guernica,painting  
 Les Demoiselles d'Avignon,painting  
 Liberty Leading the People,painting  
 Mona Lisa,painting  
 School of Athens,painting  
 Starry Night,painting  
 The Absinthe Drinker,painting  
 The Anatomy Lesson of Dr. Nicolaes Tulp,painting  
 The Arnolfini Portrait,painting  
 The Astronomer,painting  
 The Birth of Venus,painting  
 The Calling of Saint Matthew,painting  
 The Card Players,painting  
 The Death of Marat,painting  
 The Fighting Temeraire,painting  
 The Garden of Earthly Delights,painting  
 The Gross Clinic,painting  
 The Hay Wain,painting  
 The Kiss,painting  
 The Last Supper,painting  
 The Nighthawks,painting  
 The Night Watch,painting  
 The Ninth Wave,painting  
 The Persistence of Memory,painting  
 The Potato Eaters,painting  
 The Raft of the Medusa,painting  
 The Scream,painting  
 The Sleeping Gypsy,painting  
 The Son of Man,painting
